

In this lesson I demonstrate how to add API keys using the Hostinger Docker Manager, which applies if you're running OpenClaw on a VPS. If you installed OpenClaw locally on your own machine, the steps for adding the keys are simpler — instead of using Docker Manager, you can just paste your API key directly to your agent on Telegram and ask it to handle the setup. I've included a dedicated section with copy-paste prompts for local install users in the lesson resources PDF below this video. The rest of the lesson (model identifiers, smart routing, recommendations) works exactly the same regardless of which setup you have.
