

Google Workspace (GOG) — Lesson Resources

Prompts, checklist, and quick reference for the GOG setup lesson

This is a quick companion to the *Installing Google Workspace (GOG)* lesson. It contains the prompts I used in the video, a checklist of every API you need to enable, the link to Google Cloud Console, and troubleshooting tips for the most common issues. Use it as a reference alongside the video so you don't miss any steps.

Security reminder: In this lesson I recommend using a dedicated Google account for your agent (like `ace.ddagent@gmail.com`) rather than your personal Google account. This keeps your personal emails, calendar, and files completely separate from what your agent can access. If anything ever goes wrong, only the dedicated account is affected — your personal account stays safe.

APIs to Enable (Checklist)

You need to enable all six of these APIs in your Google Cloud project before the GOG skill will work. Use this as a checklist to make sure you don't miss any.

#	API Name	What It Does	✓
1	Gmail API	Read and send emails	
2	Google Calendar API	Read and create calendar events	
3	Google Drive API	Access and manage files in Drive	
4	Google Sheets API	Read and edit spreadsheets	
5	Google Docs API	Read and edit documents	
6	People API	Access your contacts	

How to enable each one: In Google Cloud Console, open *APIs & Services* → *Library*. Type the API name into the search bar, click the result, and press **Enable**. Come back to the library and do the next one. Six searches, six clicks, and you're done.

Setup Steps Summary

Here's the full process from start to finish. The video walks through each step in detail, but this gives you a quick overview so you know where you are at any point.

1. Install the GOG skill on your agent (via Telegram)
2. Create a new project in Google Cloud Console
3. Enable all 6 APIs (see checklist above)
4. Set up the OAuth Consent Screen (app name, email, External audience)
5. Add yourself as a test user in the Audience section
6. Create OAuth credentials (Desktop App type)
7. Download the client secret JSON file
8. Send the JSON file to your agent on Telegram
9. Follow the agent's instructions to complete the OAuth flow
10. Test with a read and write command to confirm it works

Prompts Used in the Video

Install the skill

Install the GOG Google Workspace skill.

Send the JSON file to your agent

Attach the downloaded JSON file to the message below and send both together:

I've gone through Google Cloud Console and enabled the APIs for all the Google Workspace services. I've also set up the OAuth consent screen and added myself as a test user. Here is the client secret JSON file. Please go ahead and connect my Google account.

Test: Write to calendar

Add a meeting with Sarah about the marketing plan to my calendar at 2pm next Tuesday.

Test: Read from calendar

What have I got on my calendar on Wednesday?

Pick your own test data: You don't have to use the exact same meeting or day as in the video. Use any event name, time, and day that makes sense for you. The point is just to confirm your agent can both write to and read from Google Calendar.

OAuth Consent Screen — What to Enter

The OAuth Consent Screen setup has several pages of questions. Here's exactly what to fill in at each step so you don't have to guess:

Field	What to enter
App name	OpenClaw (or any name you like)
User support email	Pick your email from the dropdown
Audience type	External
Contact email	Your email address again
Terms of service	Tick the checkbox and click Create
Test users	Add your own email address

Creating OAuth Credentials

Field	What to select
Credential type	OAuth Client ID
Application type	Desktop App
Name	OpenClaw (or any name you like)
After creation	Download the JSON file immediately

Don't lose the JSON file. You need to send it to your agent to complete the setup. If you accidentally close the download popup, you can find the file again by going to *APIs & Services* → *Credentials* and clicking on the OAuth client you just created. There's a download button at the top of the page.

Troubleshooting

"This site can't be reached" error page

Don't be alarmed by this — it happens every time and it's part of the normal flow. Once you've approved permissions in the browser, it redirects to a localhost address that doesn't load as a webpage. The data your agent needs is embedded in the URL itself. Grab the entire URL from the address bar and send it to your agent on Telegram. The agent knows how to extract the authorization code from it.

"Google hasn't verified this app" warning

Nothing to worry about here. Google shows this warning for any app that hasn't gone through their public verification process. Because this is a project you created yourself inside your own Google Cloud account, and you're the only person using it, there's no risk involved. Just click Continue and carry on.

Agent asks to go through OAuth again (passphrase issue)

Occasionally the agent will respond with a second authorization URL after you send the first redirect. If this happens, just go through the browser flow one more time — choose your account, grant all permissions, grab the URL from the error page, and drop it back into Telegram. The connection typically completes on the second attempt.

Agent suggests Homebrew or CLI commands

After installing the GOG skill, your agent might suggest running terminal commands or Homebrew installs. If you're on a VPS, you can safely ignore these — they're meant for local Mac setups. If you're running OpenClaw locally on a Mac, the agent's suggestions might actually be useful, but the Google Cloud Console method shown in the video works on all setups regardless.

Calendar test doesn't work

Make sure you enabled the Google Calendar API (not just the other five). Go back to *APIs & Services* → *Enabled APIs* and check that all six APIs from the checklist are showing as enabled. If one is missing, enable it and try the test again.

Permission denied errors

Double check that you added yourself as a test user in the OAuth Consent Screen → Audience section. Also make sure you ticked Select All when approving permissions during the OAuth flow in the browser. If you missed a permission, you may need to redo the OAuth flow.

After the setup is complete: You can delete the JSON file from your downloads folder if you want. Your agent already has the credentials it needs. Just don't delete the OAuth client from Google Cloud Console itself, or the connection will stop working.
