

Mini Project: Email Automation

Prompts and quick reference for this lesson

This PDF contains all the prompts from the Email Automation lesson so you can copy and paste them directly. Before you start, make sure you've completed the Google Workspace (GOG) lesson and your agent is connected to your Gmail account.

Prerequisite: The GOG skill must be installed and connected to your Google account before any of these prompts will work. If you haven't done that yet, go back to the "Installing Google Workspace (GOG)" lesson first.

Prompts Used in the Lesson

Step 1 — Check inbox and triage emails

This asks your agent to go through your unread emails and sort them by importance so you know what actually needs your attention and what you can skip.

Check my Gmail inbox and give me a summary of my unread emails. Tell me which ones need my attention and a response, and which ones I can just ignore.

Step 2 — Draft replies for important emails

Once you know which emails matter, ask your agent to read them and write draft replies. Always tell it to show you the drafts before sending — you want to review everything first.

Open the top 3 emails that need a response, read them, and draft a short reply for each one. Show me the drafts before sending anything.

Good habit: Always ask your agent to show you drafts before sending emails on your behalf. Once you're happy with a draft, you can tell the agent to send it — for example "send the reply to Sarah" and it will send it from your Gmail.

Step 3 — Set up daily email summary (cron job)

This creates a scheduled task that runs every morning and sends you a summary of new emails on Telegram. Change the time to whatever works for your schedule.

Set up a cron job that runs every morning at 8am and checks my Gmail for any new unread emails. Send me a summary on Telegram with the important ones at the top and the ones I can ignore at the bottom. Same format as you just did.

Step 4 — Choose new-since-last-run mode

Your agent will probably ask whether to show all unread emails or only new ones since the last time it ran. Pick new-since-last-run so you don't see the same emails repeated every morning.

Yes — use new-since-last-run and same format.

Ideas to Take It Further

Once you're comfortable with the basic email triage, here are some ways you can build on it:

- Set up a morning calendar briefing alongside the email summary — ask your agent to include today's meetings in the same daily report
- Create alerts for specific senders — tell your agent to notify you immediately on Telegram when you get an email from a VIP client or your boss
- Auto-categorize emails into folders — ask your agent to label and archive newsletters, receipts, and other low-priority emails automatically
- Weekly email digest — set up a separate cron job that runs on Friday afternoon and gives you a summary of everything that happened that week

Testing tip: If you want to preview your daily summary before waiting until tomorrow morning, just tell your agent "run the email triage cron job now so I can preview it" and it will run it once immediately.
