

Browsing the Web & Sub-Agents

Prompts and quick reference for this lesson

This PDF contains the Brave Search setup steps, all the prompts from the lesson, and a quick reference for working with sub-agents. Copy and paste the prompts into Telegram or your dashboard chat.

Running OpenClaw locally? Instead of adding the Brave API key through Hostinger Docker Manager, just paste it to your agent on Telegram and ask it to add `BRAVE_API_KEY` to your config. See the "Note for Local Install Users" PDF for details.

Brave Search API Setup

1. Go to brave.com/search/api and click Get Started
2. Create a free account
3. In the dashboard, go to Billing and add a payment method
4. Go to Subscriptions and start the basic Search plan
5. Set your usage limit to \$5/month (matches the free credit amount, so you pay nothing)
6. Go to API Keys, click Create, name it "OpenClaw", and copy the key
7. Add it to OpenClaw as an environment variable:

Variable Name	Where to Add It
<code>BRAVE_API_KEY</code>	VPS: Hostinger Docker Manager → Environment Local: paste to agent on Telegram

\$5 free every month: Brave gives you \$5 in free search credits each month. By setting your usage limit to \$5, you cap your spending at the free amount so you never get charged. For most personal use, \$5 worth of searches is more than enough.

Prompts Used in the Lesson

Confirm web search is working

I've added a Brave Search API key to your environment variables so you now have access to search the web. Please confirm you can see it and that it's working.

Sub-agents research example

This prompt gets your agent to spin up three separate workers that research different topics at the same time and then compile the results into one report. Swap out the platforms and questions for whatever you need to research.

I need you to research three CRM platforms at the same time and put together a detailed comparison for me. The three platforms are GoHighLevel, HubSpot, and Salesforce. For each one, I want to know what it does best, what the pricing looks like, who it's best suited for, and one major limitation or downside. Use sub-agents to research all three simultaneously, and then once they're all done, compile everything into a single summary table that I can use to make a decision.

How Sub-Agents Work — Quick Reference

Your main agent (the one you chat with on Telegram) acts as a manager. When you give it a task with multiple parts, it can create separate sub-agents that each work on one part independently. All sub-agents run at the same time, and when they're done, the main agent collects their results and puts everything together.

You can watch sub-agents working in real time by opening your gateway dashboard and checking the Sessions section. Each sub-agent shows up as its own session while it's running.

Watch the costs: Each sub-agent uses tokens in its own session. Three sub-agents running at the same time means three sets of token charges. Make sure your routing rules send research tasks to cheaper models, and save the stronger models for the main agent that compiles the final report.
