

Cron Jobs & Google Workspace Fix

What to do when your cron jobs can't access Google Calendar or Gmail

When does this happen?

This can happen after you set up cron jobs in the **Cron Jobs & Heartbeat** lesson. Your cron job runs successfully but the Google Calendar and Gmail parts come back as blocked or empty, even though they work fine when you chat with your agent directly in Telegram.

You might see an error message like **"locked gog keyring"** or **"GOG_KEYRING_PASSWORD not set"** in the cron job results.

Why Does This Happen?

When you chat with your agent directly in Telegram, the Google Workspace (GOG) skill can access your Google account because it's running in your active session which has access to the authentication tokens.

But cron jobs run in a separate background process. They don't have the same session context. The GOG skill stores your Google authentication in an encrypted keyring, and the background cron process needs a password to unlock that keyring. Without it, the cron job can't read your calendar or Gmail.

Important: This only affects cron jobs and heartbeat tasks that try to access Google services. Your normal Telegram conversations with the agent will still work fine.

How To Fix It

Step 1 — Find out your keyring password

Open Telegram and ask your agent:

```
What is the GOG_KEYRING_PASSWORD that was used to encrypt the Google keyring? I need the exact value.
```

What this does: Your agent set up the keyring when you installed the Google Workspace skill. It knows what password was used. It will tell you the value.

Step 2 — Add the password to your environment variables

Go to your Hostinger dashboard:

- Click **Docker Manager**
- Click **Manage** on your OpenClaw project
- Scroll down to the **Environment** section
- Click the **+** button to add a new environment variable
- For the name, type: **GOG_KEYRING_PASSWORD**

- For the value, paste the password your agent told you in Step 1
- Click **Save and Deploy**

Note: After clicking Save and Deploy, Hostinger will automatically redeploy your container. This takes 1-2 minutes. Wait until the status shows green "Running" before continuing.

Step 3 — Start a new session and test

Once the container is running again:

- Open Telegram and type **/new** to start a fresh session
- Type **hello** to make sure the agent is responding
- Then ask the agent to run your morning brief cron job again to test it

This time the cron job should be able to access your Google Calendar and Gmail without any issues.

If Your Agent Stops Responding After Save and Deploy

Sometimes after adding a new environment variable and redeploying, the agent might not respond straight away. This is usually just because the container is still restarting. Here's what to do:

- Wait 2 minutes for the container to fully start up
- Type **/new** in Telegram to start a fresh session
- If it still doesn't respond, open the Hostinger Terminal and run:

```
docker logs $(docker ps -aq --filter name=openclaw | head -1) --tail 10
```

What this does: Shows you the last 10 lines of output from OpenClaw so you can see if there's an error.

If the logs look normal (no errors), just wait another minute and try **/new** again.

If You See 'Config invalid' After Redeploy

When Hostinger redeploys your container after Save and Deploy, it can sometimes update OpenClaw to a newer version. If the newer version doesn't recognise a setting that your agent added earlier, OpenClaw will crash with a **Config invalid** error. For example, if your agent set up Microsoft Edge TTS when you asked it to enable voice responses in the **Voice Mode** lesson, the newer version of OpenClaw might not recognise the way that setting was stored in the config file.

To check if this is your problem, open the **Hostinger Terminal** (VPS Overview page, top right corner) and run this command:

```
docker logs $(docker ps -aq --filter name=openclaw | head -1) --tail 20
```

What this does: Shows the last 20 lines of output from your OpenClaw container so you can see the error message.

If you see something like this in the output:

```
Config invalid
Problem:
- messages.tts: Unrecognized key: "microsoft"
```

Then this is the problem. The TTS settings from the Voice Mode lesson are no longer compatible with the updated version of OpenClaw. Here's how to fix it:

Fix — Run the doctor tool

Open the Hostinger Terminal and run:

```
docker exec $(docker ps -aq --filter name=openclaw | head -1) openclaw doctor --fix
```

What this does: The doctor tool scans your config, finds invalid settings, and removes them automatically.

Then immediately stop and start the container (don't use restart — use stop then start):

```
docker stop $(docker ps -aq --filter name=openclaw | head -1) && docker start
$(docker ps -aq --filter name=openclaw | head -1)
```

What this does: Fully stops and starts the container so it picks up the fixed config. This is more thorough than a simple restart.

Wait a minute, then type **/new** in Telegram followed by **hello**.

If doctor --fix doesn't work and the error keeps coming back after restart, it means the container is overwriting the config. In that case, you need to fix and restart in one step. Copy and paste this entire command:

```
docker exec $(docker ps -aq --filter name=openclaw | head -1) sh -c 'cat
/data/.openclaw/openclaw.json | python3 -c "import sys,json;
c=json.load(sys.stdin); c.get(chr(109)+chr(101)+chr(115)+chr(115)+chr(97)+chr(103)+
chr(101)+chr(115),{}).get(chr(116)+chr(116)+chr(115),{}).pop(chr(109)+chr(105)+chr(
99)+chr(114)+chr(111)+chr(115)+chr(111)+chr(102)+chr(116),None); json.dump(c,open(c
hr(47)+chr(100)+chr(97)+chr(116)+chr(97)+chr(47)+chr(46)+chr(111)+chr(112)+chr(101)
+chr(110)+chr(99)+chr(108)+chr(97)+chr(119)+chr(47)+chr(111)+chr(112)+chr(101)+chr(
110)+chr(99)+chr(108)+chr(97)+chr(119)+chr(46)+chr(106)+chr(115)+chr(111)+chr(110),
chr(119)),indent=2); print(chr(70)+chr(105)+chr(120)+chr(101)+chr(100))"' && docker
stop $(docker ps -aq --filter name=openclaw | head -1) && docker start $(docker ps
-aq --filter name=openclaw | head -1)
```

What this does: Removes the invalid TTS "microsoft" setting from the config file and immediately restarts the container in one step, so the config doesn't get overwritten.

After this, wait a minute, type **/new** in Telegram, then **hello**. Your agent should be back online.

General Tip

If you see **any** Config invalid error that isn't covered above, the general approach is always the same:

- Check the logs to see which setting is invalid
- Run **openclaw doctor --fix** inside the container

- Stop and start the container (not just restart)
- If it keeps coming back, refer to the **OpenClaw Config Crash Fix** guide from the Telegram Groups lesson for more detailed instructions
