

Your Daily Intelligence Digest

Mini Project Guide — a personal morning briefing pulled from your calendar, inbox, memory, and task list, delivered to Telegram every day before you start work

What you'll build

In this mini project you set up a daily intelligence digest. Every morning around 7am, your agent pulls your calendar for the day, checks your recent emails, reviews its own memory of what you worked on yesterday, and puts together a clean morning briefing. The briefing shows up in Telegram before you even reach for your phone. You wake up, open Telegram, scan the digest, and you know exactly what your day looks like.

This project brings together almost everything you've learned in the course so far. Google Workspace for calendar and Gmail access, cron jobs and the heartbeat mechanism for daily scheduling, sub-agents for the heavier work, and the business brain you set up earlier so the priority list actually makes sense for your business instead of being generic.

Use your real data for the best results. The examples in this guide use placeholder calendar events and emails so the pattern is clear. When you set this up for yourself, the value comes from pointing it at your real calendar and real inbox so the briefing reflects what actually matters in your day.

What you need before starting

Before you run this project, make sure you've covered these earlier lessons: Installing Google Workspace (so your agent can read from Calendar and Gmail), Cron Jobs and Heartbeat (so you understand scheduled tasks), Browsing the Web and Sub-Agents (so you know why we offload the work to a sub-agent), and Build Your Business Brain (so the agent knows what your priorities actually are).

You also need a working Google Workspace connection with both Calendar and Gmail access granted. If you only authorised Calendar earlier, you'll need to re-authenticate with Gmail scope added. More on that in the troubleshooting section below.

The prompts used in this lesson

Here are all the prompts I used while building the digest during the recording. Use them as starting points and adjust the details to match the kind of briefing you actually want.

1. The main digest prompt

This is the one that defines what goes into the digest. If you want different sections or a different order, this is the prompt you change. Once the digest looks the way you want, the scheduled version will use this same structure every day.

PROMPT — Main digest

I want you to create a daily intelligence digest for me. Here is what I need you to include: 1) My calendar events for today — list every meeting, call, or event with the time and who it's with. 2) Email summary — check my recent emails from the last 24 hours and highlight anything that needs my attention or a reply. Flag anything urgent. 3) Yesterday's recap — what did I work on yesterday? Check your memory and daily logs for anything notable. 4) Action items — any outstanding tasks or follow-ups that I haven't completed yet. 5) Today's priority list — based on everything above, give me a suggested priority list of the three most important things I should focus on today. Format the whole thing as a clean morning briefing. Keep it concise but don't skip anything important.

2. Adjusting the format

After the first version comes through, you'll likely want to tweak things. Move the priority list to the top. Add a deadlines section. Remove things you don't care about. Here's an example of the kind of format-change prompt that works.

PROMPT — Format change example

That looks good but I want a couple of changes. Move the priority list to the very top of the digest so it's the first thing I see. And add a section called Key Deadlines This Week that checks my calendar for the next seven days and flags anything with a deadline. Update the digest format with these changes.

3. Re-running with the updated format

Once you've asked for format changes, re-run the digest to see the updated version before you schedule it. This avoids scheduling a version that doesn't actually look the way you want.

PROMPT — Rerun

Run the digest again with the updated format so I can check it.

4. Setting up the schedule

Once the digest looks right, this is the prompt that schedules it to run every morning. Note two important things in the prompt — the heartbeat mechanism (because Docker doesn't have crontab) and the sub-agent (so the heavy work doesn't time out).

PROMPT — Schedule the daily run

Set up a scheduled job to run this exact digest every day at 7am and send it to me here on Telegram. Use the heartbeat mechanism for scheduling since we're running in a Docker container without system crontab. And use a sub-agent to do the actual work so the heartbeat doesn't time out.

5. Confirming heartbeat is fine (instead of Gateway cron)

OpenClaw has two schedulers — heartbeat (which checks every few minutes) and Gateway cron (which fires at exact times). For a morning briefing, heartbeat is fine because a few minutes either way doesn't matter. If your agent asks whether you want Gateway cron instead, just tell it heartbeat is fine.

PROMPT — Stick with heartbeat

Heartbeat is fine for a morning briefing. Keep it as is and confirm everything's live.

What goes into the digest

Here's what each section of the briefing is actually doing in the background. Knowing this makes it easier to adjust the prompt when something isn't working or when you want to add a new section.

Calendar for today

The agent queries your Google Calendar through GOG and lists every event scheduled for the current day. Times, attendees, and titles. This is usually the most reliable part of the digest because Calendar data is structured and easy to fetch.

Email summary

The agent looks at the last 24 hours of emails in your agent's Gmail inbox, skims through them, and flags anything that looks important or needs a reply. The quality here depends on two things — how much context the agent has about your priorities (business brain), and how noisy your inbox is. For busy inboxes, you might want to tell the agent to focus on specific senders or folders.

Yesterday's recap

The agent pulls from its own memory and daily logs to recap what you worked on yesterday. The more you've been using your agent throughout the previous day, the richer this section becomes. If you barely talked to your agent yesterday, this section will be thin — which itself is a useful signal.

Action items

The agent checks for any outstanding tasks, follow-ups, or promises from recent conversations. If you've been using Mission Control with a task board, the agent can also pull directly from there. The goal of this section is to surface things you've said you'd do but haven't closed out yet.

Today's priority list

This is where the business brain really earns its keep. The agent takes everything from the other sections and compresses it into three things you should actually focus on today. It uses the priorities you've told it about in User.md to decide what matters most. If you skip the business brain lesson, this section still works but it gets more generic.

Troubleshooting

Google auth has expired

If the agent comes back saying it can't access your Calendar or Gmail because the OAuth token has expired or been revoked, that's normal. Google tokens can expire if the account has been unused for a while, after password changes, or if Google flags unusual activity. Just ask your agent to fix the GOG auth. It will start a fresh OAuth flow, give you a URL to click, and you sign in with the agent's dedicated Google account and paste the redirect URL back into Telegram.

Golden rule in action. If the agent initially tells you to open a terminal and run commands yourself, push back. Tell it to handle the auth flow itself and only involve you for the browser login step that only you can do. The agent should do the work, you just click and paste.

Gmail scope blocked after Calendar re-auth

Sometimes re-authenticating for Calendar fixes the calendar side but Gmail still returns insufficient permissions. This happens because adding scopes on top of existing auth doesn't always work cleanly with Google. The fix is to ask the agent to do a clean reset of the whole auth — disconnect completely, then re-auth from scratch with both Calendar and Gmail scopes included from the beginning.

PROMPT — Full GOG reset

Gmail is still blocked. Please fully reset the GOG auth from scratch. Disconnect the current auth completely, then start a fresh flow that requests both Calendar and Gmail scopes from the beginning. Give me a new auth URL.

Empty or thin yesterday's recap

If the yesterday's recap section comes back empty or very short, it usually means the agent doesn't have enough memory to pull from. Two fixes. First, make sure daily logs are being written — you can ask the agent to confirm what it remembers about yesterday directly. Second, start using your agent more throughout the day so there's actually something to recap. A recap is only as good as the day that came before it.

Digest arrives at 7:05 instead of 7:00

This is heartbeat-gated scheduling. It fires on the first heartbeat after the target time, not at the target time exactly. For a morning briefing, those few minutes really don't matter. If you genuinely need it at 7:00 sharp, switch to Gateway cron — just ask the agent to reschedule the digest using Gateway cron instead of heartbeat.

Digest doesn't arrive at all

If Monday comes and there's nothing in Telegram, start by asking the agent directly whether the scheduled job ran. The agent can check its own logs and tell you if the heartbeat fired, if the sub-agent was triggered, and if Telegram delivery succeeded. Most failures are one of three things — expired Google auth, Telegram integration broken, or the heartbeat itself being disabled.

Ways to customise this project

Once the basic digest is arriving every morning, you'll start thinking about what else could go in there. Here are some directions worth exploring after you've used it for a week.

Add a competitor section

If you built the Competitor Watch Report in the previous lesson, you can fold a short version of it into the daily digest. A couple of lines at most — just the one or two competitor moves that happened in the last 24 hours and matter most.

Flag unanswered outgoing emails

Ask the agent to look at the emails you sent in the last few days and flag any that haven't received a reply. This is useful for catching follow-ups you might have forgotten about, especially sales conversations and client check-ins.

Include status updates from other scheduled jobs

If you have multiple cron jobs running overnight — a backup, a weekly report, a data sync — the agent can include a one-line status update on each. That way if something silently failed, you know about it first thing in the morning instead of a week later when you realise the backup hasn't run.

Let the agent learn from your behaviour

Over time, tell the agent which parts of the digest you actually use and which ones you skip. It can start filtering noise out — ignore certain sender types, deprioritise routine meetings that always get moved, highlight patterns you've shown you care about. The business brain you set up earlier is what makes this kind of learning stick across conversations.

Link it into Mission Control

If you've built Mission Control, you can tell the agent to log each digest into a dedicated screen there. That way you build up a history of morning briefings and can scroll back through the week to see what the patterns have looked like.

Final note

The digest gets better the more you use your agent. The calendar section works on day one. The email summary works once your Gmail is connected properly. But the yesterday's recap and the priority list only get genuinely useful once the agent has been involved in your actual work for a while. It needs a body of memory to draw from. So don't judge this project by the first digest you get. Judge it by the digest you're getting two weeks in, when the agent actually knows what you do.
