

Apify Plugin for OpenClaw

Commands cheat sheet — copy and paste these as you follow along in the lesson. Each command has a short note on what it does.

1. Installing on your local machine

Run these one at a time in your terminal.

```
openclaw --version
```

Checks which version of OpenClaw you have. The Apify plugin needs version 2026.6 or newer.

```
openclaw update
```

Updates OpenClaw to the latest version. Only needed if the version above is older than 2026.6.

```
openclaw plugins install @apify/apify-openclaw-plugin
```

Installs the Apify plugin. This is what connects your agent to Apify's scrapers.

```
openclaw apify setup
```

Runs the setup wizard. It asks for your Apify API token, checks the connection, and writes the config for you.

```
openclaw gateway restart
```

Restarts OpenClaw so the new plugin takes effect.

```
openclaw apify status
```

Confirms everything is working — shows that your API key is set and your account is connected.

```
openclaw dashboard
```

Opens the OpenClaw dashboard in your browser, so you can chat with your agent in a nicer interface.

2. Installing on your VPS

Same commands as above — the only extra step is getting into the container first. Open the terminal from your Hostinger panel (Manage → Terminal).

```
docker ps
```

Lists your running containers. Find your OpenClaw container in the NAMES column (it looks like openclaw-xxxx-openclaw-1).

```
docker exec -it <your-container-name> bash
```

Steps inside your OpenClaw container. Replace <your-container-name> with the name from the command above. The prompt will change once you're inside.

openclaw plugins install @apify/apify-openclaw-plugin

Installs the Apify plugin, same as on local.

openclaw apify setup

Runs the setup wizard and asks for your API token, same as on local.

Then restart the gateway from your Hostinger panel to apply the changes.

3. Test prompts

Once it's set up, try these in the dashboard chat to see it in action.

Google Maps — local businesses:

"Using the Apify plugin, find me 5 coffee shops in Manchester. Return just the names, addresses, and ratings."

LinkedIn — B2B leads (using a specific scraper):

"Using the Apify plugin with the harvestapi/linkedin-profile-search actor, find me 50 founders of marketing agencies in London. For each person return their name, job title, company, and LinkedIn profile URL."

Tip: your API token works like a password — keep it private, and you can regenerate it anytime from the Apify console under Settings → API & Integrations.
