

Accessing Your Dashboard on a VPS

What to do when the Hostinger dashboard button stops working

Why can't I open the dashboard from Hostinger anymore?

During setup, we set the gateway bind to loopback. This is a security setting that means the dashboard only accepts connections coming from the server itself — not from the internet. The Hostinger panel tries to open the dashboard through a public URL, which loopback blocks. This is the correct and safe behaviour.

This is not a bug. Loopback is the recommended setting for security. It stops anyone on the internet from accessing your dashboard. The trade-off is that you need to use an SSH tunnel to access it from your own computer.

How to Access Your Dashboard

An SSH tunnel creates a secure connection between your computer and your server. It makes the dashboard available on your own computer as if it were running locally. Here's how to set it up:

Step 1 — Open a terminal on your computer

On Mac, press Command + Space, type Terminal, and hit Enter. On Windows, open PowerShell.

Step 2 — Run the SSH tunnel command

Copy and paste this command, replacing the IP with your server's Tailscale IP:

```
ssh -L 18789:127.0.0.1:18789 root@YOUR_TAILSCALE_IP
```

For example:

```
ssh -L 18789:127.0.0.1:18789 root@100.67.190.10
```

Type your root password if asked. Once connected, leave this terminal window open for as long as you want dashboard access.

Step 3 — Open the dashboard in your browser

Go to:

```
http://127.0.0.1:18789
```

Your dashboard should load. It will ask for your gateway token the first time — after that it remembers you.

Can't remember your gateway token? Just ask your agent on Telegram: "what is my gateway token" and it will give it to you in seconds.

Quick Reference

What	Command / URL
Open SSH tunnel	<code>ssh -L 18789:127.0.0.1:18789 root@YOUR_TAILSCALE_IP</code>
Dashboard URL	<code>http://127.0.0.1:18789</code>
Find gateway token	Ask your agent on Telegram
Close the tunnel	Close the terminal window or press Ctrl+C

Tip: If you use the dashboard often, save the SSH tunnel command as a shortcut or alias in your terminal so you can run it with one word instead of typing the full command every time.
