

Making Mission Control Your Own

OpenClaw Masterclass — Lesson Guide & All Prompts

What you'll build in this lesson:

- **Reverse prompted custom tool suggestions** — let the agent tell you what to build based on your business
- **Your first custom tool** — built from the agent's suggestions in one prompt
- **Real data wiring** — connect the new screen to actual task board, project, and calendar data
- **Visual polish** — coloured accents, status badges, and progress indicators
- **A template** — the exact workflow you'll use to build any future custom tool

The Custom Tool Pattern

Every custom tool follows the same four-step pattern. Memorise this — you'll use it every time you add something new to Mission Control:

Step	What You Do
1. Ask	Use reverse prompting to let the agent suggest useful tools.
2. Build	Pick one suggestion and tell the agent to build it.
3. Wire	Ask the agent to connect the new screen to real data sources.
4. Polish	Add colours, visual indicators, or fix layout issues.

All Prompts Used In This Lesson

Copy and paste these prompts into Telegram in order.

Prompt 1: Reverse Prompt for Custom Tool Suggestions

Based on what you know about me, my business, my workflows, my projects, and our mission statement, what custom tools should we build out in our Mission Control? What would make my workflow easier or give me better visibility into what's going on? Give me your top 5 suggestions with a short description of what each one would do.

Save the agent's suggestions somewhere — you'll come back to this list to build more tools later.

Prompt 2: Build the First Suggested Tool

Build that first tool you suggested and add it as a new screen in our Mission Control. Make it match the same dark style as everything else. After making the changes, rebuild for production and restart the server.

Or replace 'first' with 'second', 'third' etc. to pick a different suggestion.

Prompt 3: Wire Real Data & Add Colour

Connect the new screen to real data from the Task Board, Projects, and Calendar. Also add more colour – different accent colours for each KPI card, coloured status badges, and some visual indicators like progress bars. Keep the dark theme but make it feel more alive. After making the changes, rebuild for production and restart the server.

Use this after the first build to replace shell/placeholder data with real values and make it visually polished.

Custom Tool Ideas To Get You Started

Here are some tools that work well in Mission Control. Pick whichever ones fit your workflow:

Tool	What It Does
Business Intelligence	Executive view of KPIs, project health, and operational risks.
Client CRM	Tracks client conversations, project status, and next actions per client.
Competitor Watch	Monitors what competitors are doing — launches, pricing, content.
Content Calendar	Plans and tracks posts, videos, newsletters across all channels.
Financial Tracker	API costs, subscriptions, and revenue in one view.
Daily Standup	Morning briefing with yesterday's wins and today's focus.
Health Check	Server status, API connections, and agent performance monitoring.
Feature Request Tracker	User feedback and feature requests for your products.
Invoice Dashboard	Outstanding invoices, overdue payments, and revenue flow.
Research Library	Saved research outputs organised by topic and date.

The only limit is what you can think of. If you have an idea, just describe it to your agent and it'll build it.

Reverse Prompting Templates

Once your custom tools are built, use these prompts to get the most out of them:

Goal	Prompt
Suggest new tools	Based on how I've been using Mission Control lately, what new screen or tool would save me?
Improve existing tool	Looking at the [tool name] screen, what's missing that would make it more useful for me?
Find data gaps	What information about my business am I not currently tracking in Mission Control that I pro
Connect screens	How can we connect the [screen A] and [screen B] screens so they share data?
Automate updates	What parts of Mission Control should update automatically instead of requiring manual input

Tips for Iterating

Everything in Mission Control is a living thing. You can always go back and improve screens you've already built:

- If a screen needs an extra section, just ask the agent to add it
- If the layout breaks, send the agent a screenshot to show what needs fixing
- If data feels stale, ask the agent to set up a cron job that refreshes it automatically
- If you want a chart or graph added, describe what you want visualised
- Keep a running note of "wish list" features — tackle one per week to keep improving

Troubleshooting

Situation	What to do
Suggestions feel generic	Add more context to User.md about your goals and workflows, then ask again.
Agent built wrong thing	Tell it specifically what was wrong: "That's not what I wanted. I need X instead of Y."
New screen looks shell-like	Use Prompt 3 to wire it to real data from existing Mission Control screens.
Colours look too loud	Tell the agent: "Tone down the colours — use more muted accents but keep the dark
Screen missing from sidebar	Ask the agent: "Add the new screen to the sidebar navigation so I can get to it."
Data not updating	Ask: "Make the new screen refresh its data automatically every X seconds."

Mission Control crashed

Tell your agent: "Mission Control is down. Restart it on port 3007 in production mode"

What You've Built

- ✓ A reverse prompted list of custom tool ideas tailored to your business
- ✓ Your first custom tool added to Mission Control
- ✓ Real data wired from Task Board, Projects, and Calendar
- ✓ Visual polish with colours, badges, and progress indicators
- ✓ The four-step pattern you can reuse for any future tool
- ✓ A growing list of ideas ready to build next
